

QA Copilot — User Guide

Unified document based on the product vision, the implemented flow, and the **mock interview** and **simulated technical test** processes. Written for platform users, not developers.

1. What QA Copilot Is

QA Copilot is not a job board.

It is an **AI-powered career mentor** for QA / Testing professionals.

You find job openings the same way you always have: WhatsApp or Telegram groups, recruiters, LinkedIn, job portals, referrals, etc. QA Copilot does not replace that.

What it does is take **one specific posting** you copy and paste, analyze it against your profile, and return a **complete preparation strategy** for that role: better odds of passing ATS filters, reaching the interview, and performing well in technical tests and interviews.

One-sentence pitch

I turn any QA job posting into a personalized preparation plan to maximize your chances of landing the interview and passing the process.

Key message

We do not	Find jobs for you
We do	Turn a job posting into a strategy to get hired

Input: job posting text copied from WhatsApp, Telegram, LinkedIn, or another channel.

Output (full flow): compatibility analysis, ATS-optimized resume, application email, interview questions, selection-style test cases, mock interview with feedback, study roadmap, and optional Telegram coaching.

End goal: compete with an edge over applicants who send the same generic resume to every opening.

2. How to sign in

	URL
Login	/login/qa-copilot-dashboard
Dashboard	/qa-copilot-dashboard

Sign in with Google. Switch the interface language with **ES / EN** in the top bar.

3. Dashboard flow (4 steps)

The dashboard is organized into four sections. Jump between them with the **Profile · Offer · Mock · Extras** cards.

Quick summary

Step	Name	What you do	What you get
1	Profile & base resume	Create account, paste resume, optional QA summary / LinkedIn	Profile saved for all analyses
2	Paste posting → AI plan	Copy the full posting and click analyze	Free preview or full plan (depending on your package)
3	Mock interview	Start chat and answer questions like a real interview	Corrections, score 0–100, and level such as <i>Interview Ready</i>
4	Extras	Configure Telegram (optional)	Reminders with questions, cases, or topics to improve

4. Free preview vs full flow

QA Copilot uses a **freemium per-posting** model:

Preview (once, free)

The first time you analyze a posting **without paying**, you only see:

- **Job analysis** (role, seniority, skills, tools, domain, location, difficulty).
- **Profile match** (compatibility %, strengths, weaknesses, gaps).
- A coach message inviting you to unlock the rest.

Use it to check whether the role fits you before buying a full flow.

Full flow (with a package)

Each **full flow** uses one credit from your package and generates the complete plan for **one posting**:

Deliverable	Description
Job analysis	Same as preview, with full context
Profile match	Compatibility, strengths, weaknesses, and actionable gaps
Optimized resume	ATS-friendly text with posting keywords (downloadable)
Application email	Subject and body ready to send to the recruiter
Interview questions	Technical list based on posting skills and tools
Simulated technical test	Test cases by category (see section 7)
Express roadmap	Day-by-day plan based on your gaps
Mock interview	Available in step 3 (interactive chat)

Package overview

Package	Includes
Plan 1	1 full flow (1 posting analyzed in depth)
Plan 2	2 full flows
Plan 3	4 full flows

Pay with **ePayco**. The dashboard status bar shows how many flows you have left.

5. Detailed process: from posting to plan

This is the heart of the product. Everything starts with **pasting the full job posting text**.

Step 1 — Paste the posting

Copy exactly what you received. Real-world format examples:

Manual Tester

Manual Tester
3-4 years
Makati
Agile
Regression Testing
System Testing

API / LOS Tester

API LOS Tester
Gold Loan Domain
Postman
Swagger
API Testing

Automation

QA Automation Tester
Java
Selenium
Postman
SQL
Healthcare

No special format required: title, requirements, tools, and domain in plain text.

Step 2 — AI job analysis

The AI extracts and shows clearly:

- **Role** and **seniority**
- **Required** and **nice-to-have skills**
- **Tools** (Selenium, Postman, JMeter, etc.)
- **Business domain** (healthcare, fintech, lending, e-commerce...)
- **Location** and estimated **difficulty level**

You understand what the company really wants before applying.

Step 3 — Profile match

The posting is compared against your **resume** and **QA profile summary**.

You get:

- **Compatibility** as a percentage (e.g. 78%)
- **Strengths** already aligned with the role
- **Weaknesses** to keep in mind for the interview

- **Gaps** — skills or experience you should strengthen

This match drives the resume, roadmap, and interview questions.

Step 4 — Optimized resume (full flow)

Generates a resume tailored to **that** posting:

- Order and emphasis on relevant skills
- **Exact keywords** from the posting for ATS filters
- Readable format for applicant tracking systems

Today you receive it as **downloadable text/markdown** (optimized PDF planned as an improvement).

Step 5 — Application email (full flow)

Email ready to copy and send:

- Professional **subject** (e.g. *Application for QA Automation Tester*)
- Personalized **body** mentioning fit with the role

Cuts time between "I want to apply" and "I already sent it."

Step 6 — Interview questions (full flow)

A list of **real technical questions** based on the posting. Example content:

Selenium + Java

- What is `StaleElementException`?
- Difference between *implicit* and *explicit* wait
- How would you design a Page Object framework?

API Testing

- Difference between PUT and PATCH
- How to validate REST contracts
- Most common HTTP status codes

Manual Testing

- Regression cases
- Boundary cases
- Equivalence partitioning techniques

Important: this is **study material**. You read, practice, and prepare. It is not live corrected chat;

that is **Mock interview** (section 6).

Step 7 — Express roadmap (full flow)

Day-by-day study plan based on your gaps and the posting. Example:

Day	Topic
1	REST APIs
2	Postman Collections
3	Swagger
4	OAuth
5	Mock Interview

Each day includes concrete activities to close gaps before the real interview.

6. Detailed process: Mock interview (interactive chat)

Interview prep has **two layers**. The most powerful is practicing in conversation with AI.

Layer 1 — Plan questions (study)

When you generate the full flow, you get a **question list** based on the posting. Use it to read, research, and rehearse answers on your own.

Layer 2 — Live mock interview (practice with feedback)

Here the AI acts as a **senior QA interviewer**, not a PDF of questions.

How to use it (step by step)

1. **Generate a plan** in the *Offer* step (or have a recent posting saved).
2. Go to the **Mock** step in the dashboard.
3. Click **Start mock interview** (requires unlocked full flow).
4. The AI **greet**s you and asks the **first technical question** tailored to that posting.
5. **Type your answer** in the chat and send.
6. The AI **evaluates in real time** and returns:
 - **Score** (0–100)
 - **Level** (e.g. *Interview Ready*, *Needs Practice*)
 - **Feedback** with corrections

- **Suggested improvements**
- **Next question** (if the session continues)

7. The exchange continues **turn by turn** until the AI closes the session.

8. On screen you see the history and a summary like: **Score: 82 — Interview Ready.**

Example on-screen flow

```
AI:      Hi. Let's begin. What is StaleElementException and how would you fix it?

You:     [Your answer about locators and explicit waits...]

AI:      Feedback: good point on WebDriverWait. Missing re-locating the element.
          Level: Needs Practice
          Next: Difference between implicit and explicit wait?
```

What the platform stores

The session is saved with message history and the latest score so you can resume or review your progress.

Quick comparison

	Plan questions	Mock interview
Format	Study list	Conversational chat
Feedback	No	Yes, immediate
Score	No	Yes (0–100)
When to use	First, to research	When you want to simulate the real interview

7. Detailed process: Simulated technical test (test cases)

Many QA hiring processes do not only ask theory: they ask “**design test cases for this module / API / domain.**” QA Copilot generates that exercise from **your specific posting**.

What it is

A **simulated technical test**: real scenarios based on the posting’s stack and business. It does **not** have an automatic score (live scoring is mock interview). It is **practice material** so you are ready if they say: “*Show me how you would design cases for this role.*”

What the AI generates

If the posting asks for **API Testing**, **Postman**, and **Loan Origination System**, you get cases organized as:

Category	What you practice
Positive	Happy path flows, scenarios that should work
Negative	Errors, validations, invalid data
Boundary	Boundary values
Integration	Behavior between systems or APIs
Business	Domain rules (lending, healthcare, e-commerce, etc.)

How to use it in your prep

1. Read each category as if it were the recruiter's prompt.
2. **Write your own cases** on paper or in a tool before reading extra suggestions.
3. Compare with what was generated: did you cover negatives, boundaries, and integration?
4. Review profile **gaps** from the match together with the plan **roadmap**.

Where to see it in the dashboard

In the **Offer** step, inside the full flow result, under **Technical test — test cases**, with Positive, Negative, Boundary, Integration, and Business subsections when the AI returns them.

8. Detailed process: Extras — Telegram coaching (optional)

Not a job board or external job alerts.

It brings your prep to mobile with **@Refactorii_bot**.

What you can configure

1. Your Telegram **Chat ID** (via @userinfobot or by messaging the bot).
2. **How often** you want a message (6, 12, 24, 48, or 72 hours).
3. **Content type** to rotate:
 - **Interview** questions (Telegram mock: you reply and AI corrects)
 - **Technical test** cases
 - **Topics to improve** / roadmap from your plan
4. Enable **automatic reminders** or send a manual **test coaching** message.

How it fits the rest

- Messages come from the **latest preparation plan** you generated.

- Interview questions on Telegram require a **full flow**.
- Gap reminders can also use preview content when available.

9. End-to-end flow (user example)

María is a tester with 3 years in manual testing and some API experience. She receives this on Telegram:

```
QA Automation – Bogotá remote
Java, Selenium, Postman, SQL
Domain: insurance
3+ years
```

What María does:

1. Opens QA Copilot and completes **Profile** with her resume.
2. Pastes the posting in **Offer** → first time sees **78% compatibility** and gaps in Selenium framework (free preview).
3. Buys **1 full flow** and analyzes the same posting again.
4. Downloads optimized resume, copies the email, studies **plan questions**.
5. Practices the **simulated technical test** (positive/negative/boundary cases for policy APIs).
6. Follows the **5-day roadmap**.
7. In **Mock**, runs 2 sessions until **Score 85 — Interview Ready**.
8. Enables **Telegram**: every 24 h she gets a question and replies in the bot chat.
9. Applies with the generated email and tailored resume.

María did not “find” the job on QA Copilot; she **prepared** for the one she already had.

10. What QA Copilot is NOT (clear boundaries)

To avoid confusion:

QA Copilot is not	QA Copilot is
Job portal	Per-posting preparation mentor
LinkedIn/Indeed crawler for you	Analysis of the posting you paste
Mass auto-apply (<i>Apply with AI</i> at scale)	Email and resume ready for one posting you choose
Certified exam with diploma	Simulation and practice with AI
A substitute for studying	An accelerator: tells you what to study and how to practice

Future product ideas (standalone case generator, job channel, mass apply) may evolve, but **the current product** focuses on: **one posting** → **one plan** → **better preparation**.

11. Visual value summary

12. Technical support (quick reference)

Deployment and Telegram cron documentation: `modelos_back/static/LEEME-QA-COPILOT.txt`.

QA Copilot — AI Powered. Testing Empowered.

We don't help you find jobs. We help you win them.
